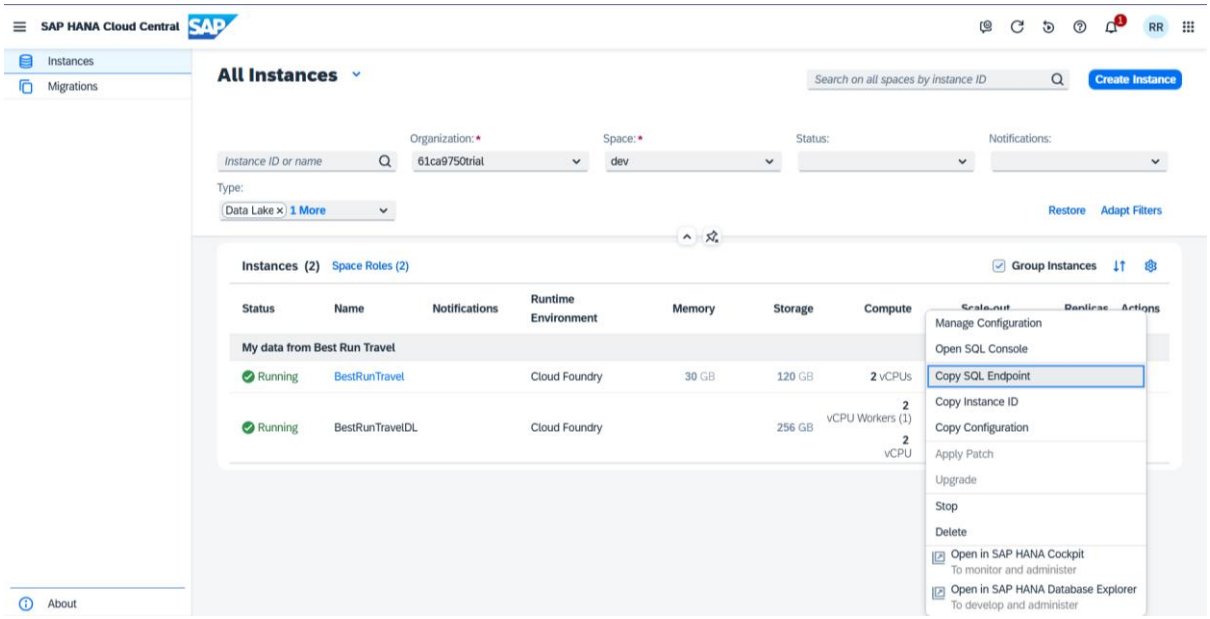
Getting Started with SAP HANA Cloud

2. Modul 2 : Tools to Work With SAP HANA Cloud

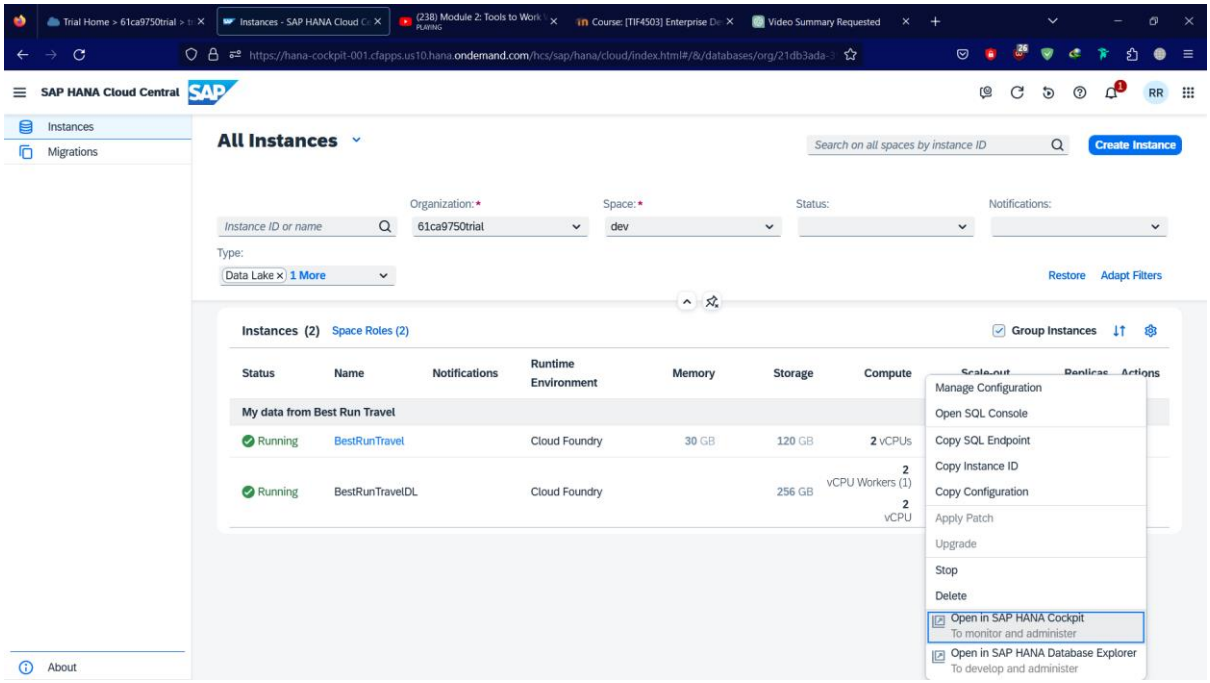
- Interacting with SAP HANA Cloud Tools

In this step, users should click on the "Manage HANA Cloud" option. Upon doing so, they will be presented with a list of instances that have been created under their account. Additionally, users can easily locate the endpoint address of their specific instance within this section, providing them with essential information for further interactions with their SAP HANA Cloud setup.

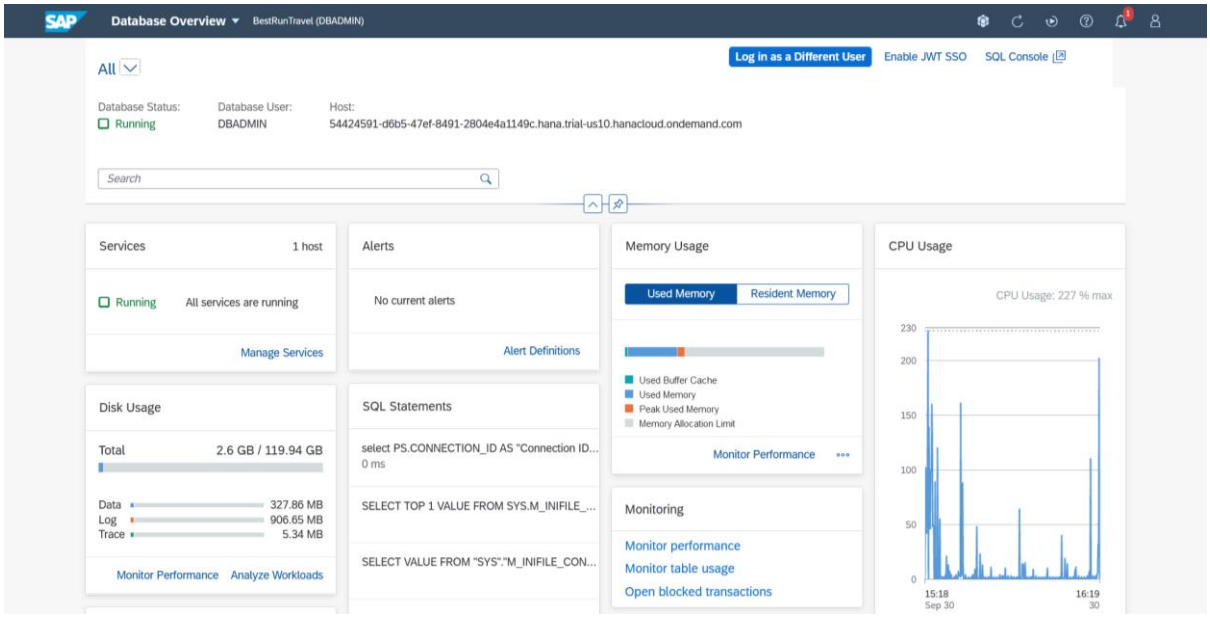


- Using SAP HANA Cockpit

To open the SAP HANA Cockpit, users should click on the three dots adjacent to the database instance and then choose "Open in SAP HANA Cockpit." It's important to note that they will be prompted to provide the initial database username (dbadmin) and the corresponding instance password for access.



Within the SAP HANA Cockpit, users can engage in various tasks, including monitoring the status of their database, tracking memory and CPU usage, and managing security settings.



- Using SAP HANA Database Explorer

  To access the SAP HANA Database Explorer, users should return to the SAP Cloud Platform, locate the instance tile, and then click on the actions button, selecting "Execute SQL." This action initiates the opening of a new tab featuring the Database Explorer.

  Users can observe a list of databases on the top left section and access the catalog associated with the instance. The catalog serves as a hub for interacting with data stored in databases, managing remote sources, and other essential functions.
